Ethylene Glycol Monoethylene Glycol Meg Production Industrial routes. Ethylene glycol is produced from ethylene (ethene), via the intermediate ethylene oxide. Ethylene oxide reacts with water to produce ethylene glycol according to the chemical equation:
$$C_2H_4O + H_2O \rightarrow HO-CH_2-CH_2-OH$$
. This reaction can be catalyzed by either acids or bases, or can occur at neutral pH under elevated temperatures. Ethylene glycol - Wikipedia Monoethylene Glycol (MEG) Ethylene glycol is a colorless, practically odorless, low-volatility, low-viscosity, hygroscopic liquid. It is completely miscible with water and many organic liquids. Ethylene glycol is produced from

MEGlobal's monoethylene glycol (MEG) is a basic building block used for applications that require:

Chemical intermediates for resins.

Solvent couplers. MEGlobal |

Monoethylene Glycol The product is extremely hygroscopic. MEG is miscible with water, alcohols, aldehydes, ketones and esters.

Monoethylene glycol can be used as an intermediate in the production of solvents and resins or as a building block in PET to produce fibers.

Furthermore, MEG is commonly used as a raw material for antifreeze fluids. Technical Data

Sheet MONOETHYLENE GLYCOL (MEG) MONO ETHYLENE GLYCOL ANTIFREEZE COOLANT. Other names: monoethylene glycol, MEG, 1,2-ethanediol, monoethylene glycol anti freeze coolant. The main use of mono ethylene glycol antifreeze coolant is for car antifreeze. It is used in cells cooling the car, the plane, the bus and all automotives. The monoethylene glycol anti freeze, having a low freezing point mixed with water, is commonly used in air conditioning as glycol cooling works below freezing temperature of 0 Â°C. Mono Ethylene Glycol - antifreeze (Monoethylene Glycol / MEG) Monoethylene glycol (MEG) in its pure form, it is an odorless, colorless, syrupy liquid with a sweet taste. Ethylene Glycol: HOCH 2CH
